Leading Health Conditions Impacting Student Attendance

Central to the connection between health and learning is students attending schools. Many students have one or more health problems that compromise their ability to learn and put them at risk for missing school. The prevalence of many of these conditions, including both physical and behavioral health conditions, has increased significantly over the past two decades. This has implications not only for children’s long-term health but also for their opportunities to learn and succeed at school. The chart below identifies health conditions that have high prevalence among children, disproportionately impact children of color and have a direct impact on student attendance. Fortunately, research shows that there are proven or promising school-based programs to address each of these health conditions.

This chart was prepared by the National Collaborative on Education and Health, an initiative co-convened by Healthy Schools Campaign and Trust for America’s Health that is working to transform the health and education sectors to support the conditions of health in schools across the country. The National Collaborative on Education and Health has brought together over 100 stakeholders representing federal, state and local government agencies, health and education professionals, advocates and foundations.

### Food insecurity and nutrition
- 21% of children (<age 18) live in households that have been food-insecure at some point during the year.\(^xviii\)
- 31.8% of children and adolescents are overweight or obese.
  - 18% of children aged 6-11 years old are obese.
  - 21% of children aged 12-19 years old are obese.\(^xx\)

Food insecurity is more than twice as prevalent among children in households headed by African Americans (36%) or Hispanics (30%), than in those headed by Caucasians (15%). The proportion of households where children had “very low food security,” is between three and four times as high in African American or Hispanic households as it was in Caucasian households.\(^xx\)

32.5% of African American children and 38.9% of Hispanic children are overweight or obese compared to 28.5% of Caucasian children.\(^xxi\)

Children who come from food-insecure families are more likely to be suspended from school, have higher absenteeism rates and have poor health compared to children who come from food-secure homes.\(^xxii\)

Children who are obese are 1.7 times more likely to have 10 or more absences in a given year than their non-obese peers.\(^xxiii\)

Overweight children are exposed to negative social experiences such as peer rejection and bullying which may lead to low self-esteem, anxiety disorders and depression.\(^xxiv\)

### Mental health and substance use disorders
- A total of 13%–20% of children experience a mental disorder in a given year.\(^xxv\)
- ADHD (6.8%) is the most prevalent parent-reported current diagnosis among children aged 3–17 years, followed by behavioral or conduct problems (3.5%).

ADHD disproportionately affects urban minority youth from poor families, who may not only be more likely to be affected but also less likely to receive accurate diagnosis and treatment.\(^xxviii\)

Minorities have less access to mental health services and are less likely to receive needed care.\(^xxx\)

When students' mental health needs are met, they are less likely to be absent and more likely to be engaged in and have a sense of connectedness to school.\(^xxxi\)

Children affected by ADHD are more likely to exhibit tardiness and School-based mental health programs.

School-based mental health programs.

Screening, Brief Intervention, and Referral to Treatment (SBIRT)

Universal interventions such as the Good Behavior Game

- Local departments of health and public health
- Teachers unions
- Food service directors
- Local food banks
- Local anti-hunger groups, including Feeding America
- School staff, including food services team and facility and maintenance team
- Community food and fitness organizations
- Local health care providers
- Farmers markets

| Local departments of health and public health |

| Farmers markets |
anxiety (3.0%), depression (2.1%) and autism spectrum disorders (1.1%).
- 25% of children in need of mental health care get the help they need.
- 8.8% of adolescents report current illicit drug users.
- 20.8% of adolescents report binge-drinking (five or more drinks of alcohol in a row within two hours) in the past 30 days.
- 8.6% of students tried marijuana for the first time before age 13.

African American and Latino youth are more likely to drink alcohol for the first time before age 13 (21.0% and 21.8% vs. 16.7%).
African American and Latino youth are more likely to try marijuana for the first time before age 13 (11.5% and 11.7% vs. 6.6%).

**Absence in attendance due to sleep problems caused by the disorder.**
Reduction of alcohol and drug use is associated with better attendance rates.
There is a 10% increase in attendance for every year that the student delays beginning marijuana or alcohol use.

**Teen and unplanned pregnancies**
3 in 10 teen American girls will get pregnant at least once before age 20.

Teenage birth rates in African American and Latino communities are three and four times higher than in Caucasian communities.

Teens who become pregnant are more likely to be chronically absent, less likely to stay in school, and less likely to complete high school or college.

School and community-based health, counseling and social services, including access to contraception.

**Vision**
25 percent of school-aged children have some form of vision impairment.

Low-income and minority youth are at greater risk of under diagnosis and under treatment of vision problems and unmet need for vision care services.

Students with vision impairments are at an increased risk of disengagement from school and are more likely to develop social and emotional problems.

School-based vision screening programs
